```
void setup()
  pinMode(LED_PIN, OUTPUT);
  Serial.begin(115200);
 while(! Serial);
  // conecta como io.adafruit.com
  Serial.print("Conectando com Adafruit IO");
  io.connect();
```

```
// configura um gerenciador de mensagens
// para o feed 'digital'.
// a função handleMessage será chamado sempre
   que uma mensagem for recebido de adafruit io.
digital->onMessage(handleMessage);
// aguarda a conexão
while(io.status() < AIO_CONNECTED)</pre>
  Serial.print(".");
  delay(500);
```

```
// estando conectado
Serial.println();
Serial.println(io.statusText());
digital->get();
}
// Chel Chaparro
```

```
void loop()
{
    // mantém o cliente conectado
    io.run();
}
Prof. Michel Chaparro
```

```
// esta função é chamada sempre que uma mensagem
// de feed 'digital'é recebido da Adafruit IO
void handleMessage(AdafruitIO Data *data)
 Serial.print("recebido ( "); haparro
 if(data->toPinLevel() == HIGH)
   Serial.println("HIGH");
 else
   Serial.println("LOW");
 digitalWrite(LED_PIN, data->toPinLevel());
```
